Important Notes

The purpose of this script is to determine species richness by species of grazers and reef-dependent species, create managed area statistics, generate plots, and create reports in pdf form for Coral data.

These scripts were created by [J.E. Panzik \(jepanzik@usf.edu\)](mailto:jepanzik@usf.edu) for SEACAR. Updated by [T.G. Hill \(Tyler.Hill@FloridaDEP.gov\)](mailto:Tyler.Hill@FloridaDEP.gov).

All scripts and outputs can be found on the SEACAR GitHub repository:

https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses

This markdown file is designed to be compiled by `Coral_SpeciesRichness_ReportRender.R` (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/blob/main/Coral/Coral_SpeciesRichness_ReportRender.R).

Libraries and Settings

Loads libraries used in the script. The inclusion of `scipen` option limits how frequently R defaults to scientific notation. Sets default settings for displaying warning and messages in created document, and sets figure dpi.

File Import

Imports file that is determined in the Coral_SpeciesRichness_ReportRender.R script.

The command `fread` is used because of its improved speed while handling large data files. Only columns that are used by the script are imported from the file, and are designated in the `select` input.

The script then gets the name of the parameter as it appears in the data file and units of the parameter.

The latest version of Coral data is available at: <https://usf.box.com/s/8hyj2ur5arothlifglisnq2gxisjzbdg>

The file being used for the analysis is: **All_CORAL_Parameters-2025-Mar-06.txt**

```
# Gets the files with the file names containing the desired parameter
file_in <- list.files(seacar_data_location, pattern="All_CORAL", full=TRUE)

# Reads in data file using fread
data <- fread(file_in, sep="|", header=TRUE, stringsAsFactors=FALSE,
              na.strings=c("NULL", "", "NA"))

cat(paste("The data file(s) used:", file_short, sep="\n"))
```

Data Filtering

The processing and filtering that is done to the data is as follows:

1. Only take data rows that are Presence/Absence measurements for SpeciesGroup1 values “Grazers and reef dependent species” and “Reef fish”
2. Set parameter names to Species Richness
3. Sets units
4. Removes rows that contains NA values in ManagedAreaName, GenusName, SpeciesName, Month, Year, SpeciesGroup1, and removes invasive species data
5. Sets ResultValue to be numeric values and removes rows where presence is 0
6. Removes duplicates (MADup==1)
7. Combines genus and species names
8. Corrects some managed area names to match what is being used with other habitats
9. Creates species richness data set
 - Grouped based on common ManagedAreaName, ProgramID, ProgramName, ProgramLocationID, and SampleDate
 - SpeciesRichness determined based on the number of unique species (`gensp`) in each group
10. Merges data with managed area data to determine correct AreaID
11. Writes to file with “_UsedData” file name to indicate what data was used for species richness.

```
# Only keep data for Presence of grazers and reef-dependent species
data <- data[ParameterName=="Presence/Absence" &
             SpeciesGroup1 %in% c("Grazers and reef dependent species",
                                  "Reef fish"), ]

# Create ParameterName Column
data$ParameterName <- "Species Richness"
parameter <- "Species Richness"
title_param <- "Species Richness - Grazers and Reef-Dependent Species"

# Sets units for species richness
unit <- "# of species"
data$ParameterUnits <- unit
```

```

# Remove rows with missing ManagedAreaName

data <- data[!is.na(data$SpeciesName),]
# Remove rows with missing Months
data <- data[!is.na(data$Month),]
# Remove rows with missing Years
data <- data[!is.na(data$Year),]
# Remove rows with missing SpeciesGroup1
data <- data[!is.na(data$SpeciesGroup1),]
# Set ResultValue to be a number value
data$ResultValue <- as.numeric(data$ResultValue)
# Remove rows where ResultValue is 0 and missing
data <- data[data$ResultValue!=0,]
data <- data[!is.na(data$ResultValue),]
# Remove duplicate rows
data <- data[data$MADup==1,]
# Create variable that combines the genus and species name
data$gensp <- paste(data$GenusName, data$SpeciesName, sep=" ")

# Create Species Richness values for groups of unique combinations of
# ManagedAreaName, ProgramID, ProgramName, ProgramLocationID, and SampleDate.
data <- data[data$ResultValue==1] %>%
  group_by(AreaID, ManagedAreaName, ProgramID, ProgramName, ProgramLocationID,
    SampleDate) %>%
  summarise(ParameterName=parameter,
    Year=unique(Year), Month=unique(Month),
    SpeciesRichness=length(unique(gensp)))
setDT(data)

# Writes this data that is used by the rest of the script to a text file
fwrite(data, paste0(out_dir, "/Coral_", param_file, "_UsedData.txt"),
  sep="|")

# Makes sure SampleDate is being stored as a Date object
data$SampleDate <- as.Date(data$SampleDate)

# Creates a variable with the names of all the managed areas that contain
# species observations
coral_sr_MA_Include <- unique(data$ManagedAreaName[!is.na(data$SpeciesRichness)])

# Puts the managed areas in alphabetical order
coral_sr_MA_Include <- coral_sr_MA_Include[order(coral_sr_MA_Include)]

# Determines the number of managed areas used
n <- length(coral_sr_MA_Include)

```

Managed Area Statistics

Gets summary statistics for each managed area. Uses piping from dplyr package to feed into subsequent steps. The following steps are performed:

1. Group data that have the same `ManagedAreaName`, `Year`, and `Month`.
 - Second summary statistics do not use the `Month` grouping and are only for `ManagedAreaName` and `Year`.
 - Third summary statistics do not use `Year` grouping and are only for `ManagedAreaName` and `Month`
 - Fourth summary statistics are only grouped based on `ManagedAreaName`
 - Determines the years that the minimum and maximum species richness occurred
2. For each group, provide the following information: Parameter Name (`ParameterName`), Number of Entries (`N_Data`), Lowest Value (`Min`), Largest Value (`Max`), Median, Mean, Standard Deviation, and a list of all Programs included in these measurements.
3. Sort the data in ascending (A to Z and 0 to 9) order based on `ManagedAreaName` then `Year` then `Month`
4. Write summary stats to a pipe-delimited .txt file in the output directory
 - [Coral Species Richness Output Files in SEACAR GitHub](https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/tree/main/Coral/output/SpeciesRichness) (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/tree/main/Coral/output/SpeciesRichness)

```
# Create summary statistics for each managed area based on Year and Month
# intervals.

```

Appendix I: Managed Area Species Richness

The plots shown here are the species richness for each managed area with a yearly average.

1. Set common plot theme.
2. Determine the earliest and latest year of the data to create x-axis scale and intervals
3. Determine the upper and lower limit of the plot for better y-axis labels
4. Add the plot line
5. Set the plot type as a point plot with the size of the points
6. Create the title, x-axis, y-axis

7. Set the y and x limits
8. Apply common plot theme
9. Add table with summary statistics below each figure
 - Numerical non-integer values are rounded to 2 decimal places
 - StandardDeviation is renamed StDev for space reasons
10. Create file name to save figure
11. Save figure as png file
 - Coral Species Richness Figures in SEACAR GitHub (https://github.com/FloridaSEACAR/SEACAR_Trend_Analyses/tree/main/Coral/output/SpeciesRichness/Figures)

```
# Defines standard plot theme: black and white, no major or minor grid lines,
# Arial font. Title is centered, size 12, and blue (hex coded). Subtitle is
# centered, size 10, and blue (hex coded). Legend title is size 10 and the
# legend is left-justified. X-axis title is size 10 and the margins are padded
# at the top and bottom to give more space for angled axis labels. Y-axis title
# is size 10 and margins are padded on the right side to give more space for
# axis labels. Axis labels are size 10 and the x-axis labels are rotated -45
# degrees with a horizontal justification that aligns them with the tick mark
plot_theme <- theme_bw() +
